

use XMLTV::Compile;

Configuration of channels and
video sources in MythTV with Perl

Nick Morrott
mk.pm, May 2012

*“Man came by to hook up my cable TV
We settled in for the night my baby and me
We switched 'round and 'round 'til half-past dawn
There was fifty-seven channels and nothin' on”*

Bruce Springsteen

“57 Channels (And Nothin' On)”

Background

- MythTV is a powerful, open source digital video recorder, supporting DVB-T/S/C tuners and analog MPEG-2 encoders
- MythTV configuration is stored in a MySQL database
- **Configuration and maintenance of channels (especially with XMLTV) can be a PITA**

Current solutions

- Configure once and never touch again
- Configure with a likely out-of-date shell/SQL script
- Stick to EIT (over-the-air) listings and default channel assignments

Motivation

- Make channel reconfiguration a simple and reproducible process
- Cater for users with Sky/Virgin services where all channels must be added and reconfigured manually (that's 100's...)
- Learn more about XML::Compile, XML Schema creation, XPath and XSLT

My Cunning Plan

- 1) Implement the oft-talked-about “lineups” feature within the XMLTV project for managing available channel listings
- 2) Write a tool for managing channel configuration in MythTV using this data
- 3) ???
- 4) Profit!

In case you were wondering...

- Step 3 on the previous slide turned out to be “happen to attend 2011's mk.pm technical talk where Colin Bradford talked about XML::Compile”
- I overestimated Step 4...

Part 1
Generating Lineups

XMLTV Lineups

- Problem: XMLTV needs an agreed way to describe available channels on a given TV/radio/IP platform
- A couple of proposals were drafted in 2008, but nothing happened
- After hearing about XML::Compile at a previous mk.pm I thought I'd have a go

Lineups Implementation

- Write an XSD to describe the concept and structure of a lineup
- Write a tool to generate a code structure representing the XML document structure described in the XSD
- Use XML::Compile to validate the code structure and generate XML

Lineups XSD

- Intended to describe an Electronic Programme Guide (EPG) and its entries
- Separates the concept of stations (content, e.g. BBC1 West Midlands) from channels (physical broadcast, e.g. DVB-T, onid 9018, sid 4165), with 1-to-many relationship
- Each channel element will contain only the tuning information relevant to its sub-type

Assembling the data

- EPG lineups are retrieved by scraping Wikipedia (and updated if necessary)
- Digital channel data is obtained via `scan` from DVB-T/S tuners
- XMLTV configuration and channel logo data is obtained from `tv_grab_uk_rt`
- A utility merges these sources, producing the input data structure for `XML::Compile`

XML::Compile

```
use XML::Compile::Schema;  
use XML::LibXML;
```

```
my $schema = XML::Compile::Schema->new('xmltv-lineups.xsd');  
my $doc = XML::LibXML::Document->new('1.0', 'UTF-8');  
my $writer = $schema->compile(WRITER => 'xmltv-lineups');  
my $xml = $writer->($doc, $xml_lineups_href);
```

```
my $pi = $doc->createProcessingInstruction("xml-stylesheet");  
$pi->setData(type=>'application/xml', href=>'xmltv-lineups.xsl');  
$doc->appendChild($pi);  
$doc->setDocumentElement($xml);  
print $doc->toString(2);
```

TV platform support

- The lineup generator currently creates “master” channel lineups for:
 - Freeview
 - Freesat
 - Sky
 - Virgin
 - Saorview
 - UPC Ireland

Sample Freeview <lineup-entry>

```
<lineup-entry>  
  <preset>2</preset>  
  <section>General entertainment</section>  
  <package type="basic">Free-to-air</package>  
  <availability area="country">England</availability>  
  <station>...</station>  
  <dvb-channel>...</dvb-channel>  
</lineup-entry>
```

Sample <station>

```
<station rfc2838="bbc2.bbc.co.uk" type="TV">  
  <name lang="en-GB">BBC Two England</name>  
  <short-name lang="en-GB">BBC Two</short-name>  
  <logo  
    url="http://www.lyngsat-logo.com/logo/tv/bb/bbc2.jpg"  
    height="99" width="132"/>  
  <commercial-free>true</commercial-free>  
  <video>  
    <format>SDTV</format>  
    <aspect-ratio>16:9</aspect-ratio>  
  </video>  
</station>
```

Sample <dvb-channel>

```
<dvb-channel>  
  <original-network-id>9018</original-network-id>  
  <service-id>4287</service-id>  
  <lcn>2</lcn>  
  <service-name>BBC TWO</service-name>  
  <encrypted>>false</encrypted>  
</dvb-channel>  
</lineup-entry>
```

Part 2

Using Lineups in XMLTV

Supporting lineups in XMLTV

- Add new grabber capability “lineups”
- Implement required functionality:
 - Add support to core XMLTV libs
 - Implement callbacks in tv_grab_uk_rt
- New grabber options available:
 - list-lineups
 - get-lineup

Lineups grabber options

- `--list-lineups`
 - Produces an XML document listing all platform lineups supported
- `--get-lineup`
 - Produces a (filtered) lineup using the information provided at configuration

(XML produced by these options must validate against the `xmltv-lineups XSD`)

Refining a lineup

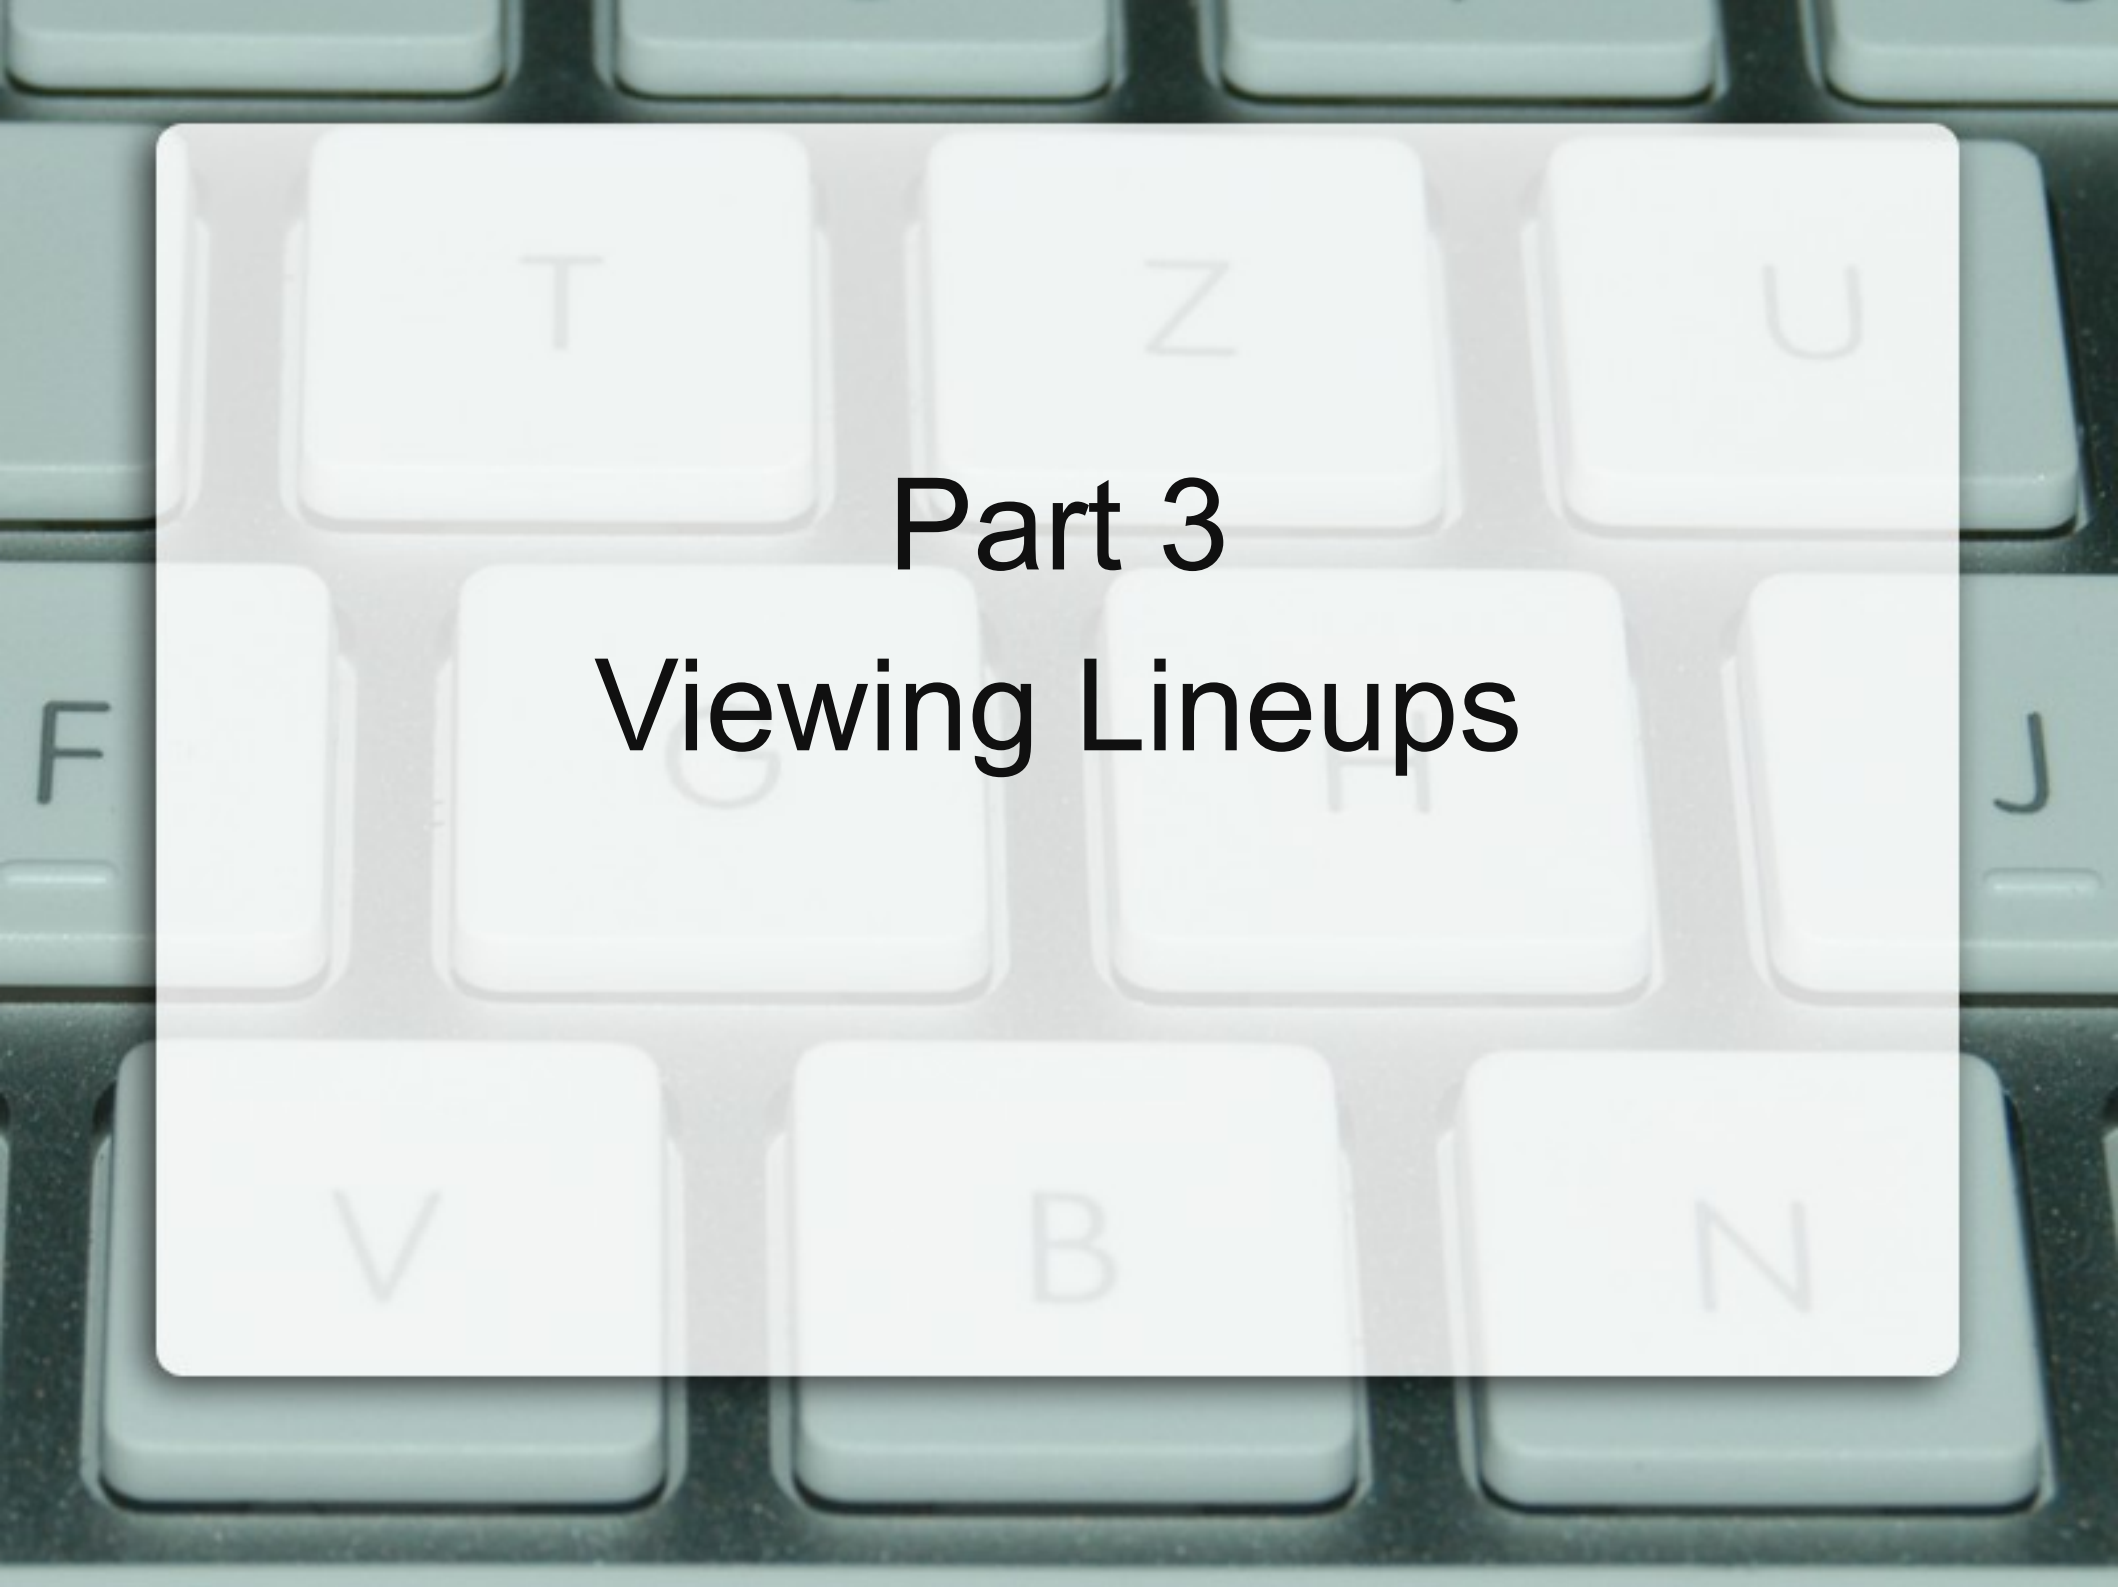

- Each “master” platform lineup generated by XML::Compile covers all regions served by a platform, permitting a single document per platform, but...
- The end-user (or consuming app) wants a lineup that (ideally) only includes the channels available in the user's location and to which they subscribe

Personalising lineups

- During configuration of tv_grab_uk_rt, the user is asked for details of:
 - Country
 - Postcode
 - TV platform
 - Subscribed packages*
 - Premium channels*
- (* if relevant)

Lineup filtering

- Retrieve “master” platform lineup
- Process the document with XML::LibXML using XPath to get details of geographic and package availability for channels
- Remove extraneous `<lineup-entry>` entries
- Output filtered lineup (when called with `--get-lineup`)

Part 3
Viewing Lineups

Quick and dirty validation

- Problem: The lineups XML is human-readable, but it's not easy to quickly see if it contains what you expect.
- Solution: Use XSL Transformations (XSLT) to transform the lineups document into a simple HTML document that can be scanned quickly

| Preset | Icon | Name |
|--------|---|-----------------------|
| 101 |  | BBC One West Midlands |
| 102 |  | BBC Two England |
| 103 |  | ITV1 |
| 104 |  | Channel 4 |
| 105 |  | Channel 5 |
| 106 |  | BBC Three |
| 107 |  | BBC Four |

Not much further to go...

- At this point, filtering available channels (and therefore TV listings) is available within the `tv_grab_uk_rt` grabber - and - we can view lineups

BUT

- Most users want XMLTV configured in their PVR software (and this is where the pain lies)

Part 4

Configuring MythTV with XMLTV Lineups

MythTV Perl bindings

- MythTV has included Perl bindings for several releases
- Auto-detect database connection settings
- Use Perl DBI to talk to the MythTV database:

```
use MythTV;  
my $Myth = new MythTV();  
my $sh = $Myth->{'dbh'}->prepare("UPDATE channel...
```

MythTV Services API

- MythTV 0.25 (released April 2012) includes a new Services API framework
- Allows configuration of many MythTV aspects with HTTP/REST
- However, many users are still using older versions of MythTV so I went with the bindings for the first version

MythTV Lineup Tool

- Intended to be “the one ring”
- Allow existing DVB-based videosources and channels to be reconfigured
- Allow STB-based videosources (e.g. Virgin, Sky) to be created and populated with configured channels
- Permit use of either EIT (where available) or XMLTV listings data

What does it do?

- Renumbers channels per platform EPG
- Updates channel name/short-name/callsign
- Downloads and configures channel icons
- Configures XMLTV ID
- Hides all extraneous channels on source (e.g. this removes ~400 FTA non-Freesat channels from the MythTV EPG)

Example Usage

- **Generate lineup file:**

```
tv_grab_uk_rt --configure
```

```
tv_grab_uk_rt --get-lineup > freesat.xml
```

- **Configure MythTV (DVB sources):**

```
lineup_tool --source-id 1 --lineup-xml freesat.xml
```

- **Configure MythTV (STB sources):**

```
lineup_tool --source-name "Virgin" --lineup-xml virgin.xml
```

Freesat (before lineup tool, 558 channels)

| | ◀ | 08:00 PM | 08:15 PM | 08:30 PM | 08:45 PM | 09:00 PM | 09:15 PM | 09:30 PM | 09:45 PM |
|-----------------|---|----------|----------|----------|----------|----------|----------|----------|----------|

|  101 | Holby City: Coercion | | | | Crimewatch | | | |
|  102 | Hairy Bikers' Bakeation: Spain | | | | Meet the Romans with Mary Beard: Behind Closed Doors | | | |
|  103 | William and Kate: The First Year | | | | The Hunt for bin Laden | | | |
|  104 | Supersize vs Superskinny | | | | Hidden Talent | | | |
|  105 | War Hero In My Family | | | | CSI: Crime Scene Investigation | | | |
|  106 | Young, Dumb and Living off Mum | | | | Britain Unzipped | | | |
|  107 | The Story of British Pathé: The Birth of the News | | | | Yellowstone: Unnatural Histories | | | |

Future plans

- Support for renumbering channels on a given platform's EPG to those of another
- Testing across all supported platforms
- Develop XSD
- Support for MythTV's Services API
- Investigate adding support directly into MythTV using XMLTV's apiconfig feature

Questions?

“I can see by your eyes friend you're just about gone
Fifty-seven channels and nothin' on”

Bruce Springsteen

“57 Channels (And Nothin' On)”
